

FRC FLUID

Fire resistant protective coating

Description

Special single-component protective coating based on polymers in water dispersion, UVresistant pigments, additives to improve workability and special non-toxic inorganic compounds which give the product a flame retardant action.

The flame-retardant action remains active for a long time and is not affected by water or atmospheric agents.

However, it is still advisable to inspect the surface 4-5 years after laying.

Fields of use

It is used to give a flame-retardant and, at the same time, protective action to various surfaces (wood, concrete...), to roofing in EPS, polyurethane or bitumen-polymer membranes, both new and existing.

The flame-retardant action is performed with a thickness of only 2 mm even using FRC FLUID directly on non-flame-retardant insulating panels and without the need to insert any type of barrier or flame-retardant fabric into the product.

FRC FLUID has been tested by Istituto Giordano, classified B_{ROOF} (t2) according to UNI EN 13501-5 : 2016 (Fire classification of construction products and elements).

The test has been performed <u>spreading the</u> product directly on a 50 mm NON FIRE <u>RESISTANT EPS panel (density 20 kg/m³)</u>, without adding any separating layer or intermediate reinforcement.

Therefore, the product is applicable <u>on</u> combustible material with density ≥ 15 kg/m³ and non-combustible material, as reported in the certificate.

Furthermore, the white colour, in addition to extending the life expectancy of any waterproofing, can also help reducing the temperature of the building.

Preparation of the support, application and consumption

The surface must be clean of any substance that could compromise adhesion, free from fatty oils, dry and with correct slopes to avoid water stagnation.

Old water-based protective paints can be overcoated as long as they are perfectly anchored to the substrate, otherwise total preventive removal is necessary.

Do not apply the product with temperatures below $+10^{\circ}$ C, relative humidity greater than 75% and in adverse climatic conditions (predicted rain, wind, temperatures other than those listed below).

The product is ready to use; just before application, mix briefly with a mechanical stirrer to restore homogeneity.

Apply the product with a brush, roller for liquid sheaths or airless spray.

We always recommend a first priming coat, using FRC FLUID diluted with about 10% of water by weight (consumption about 250 g/ m^2).

Apply the product in at least 2 coats, based on the final thickness you want to obtain (the certification is obtained on a dry film thickness of 2 mm). The second layer must be applied after the previous one has completely dried, generally after 6-12 hours (depending on the humidity, temperature and porosity of the substrate).

Instructions safety

The product does not require labeling according to current CE regulations. It does not contain solvents and is not harmful to health.

It is advisable to use protective gloves and goggles or other devices required by health and safety standards.

After use, do not disperse the containers.

Packaging and storage

It is supplied in 20 kg buckets on 42-piece pallets.

The product fears frost, therefore it is recommended to keep it in the original, sealed containers and at temperatures between $+5^{\circ}$ C and $+35^{\circ}$ C, away from the sun and frost.

Use within 12 months of packing date.

Giordano Institute Certification – Fire classification of construction products and elements according to UNI EN 13501-5:2016 – Classification report No. 406928

Technical data			ID MAGS16
Product identification data / technical characteristics	Norm	Average value	Tolerance
Appearance		Semi-opaque film	
Colour		White, black	
Viscosity		8000 cPs	± 2000
Specific weight	ISO 2811-1	1,30 g/cmc	± 0,05
Residual dry matter	ISO 3251	68%	± 2 pp
pH	ISO 2431	8,0 u.pH	± 0,5
Flash point		Not flammable	
Physical - mechanical characteristics	Norm	Average value	Tolerance
Cold flexibility

The product can only be walked on for maintenance and repairs. Protective paints for waterproofing membranes or cementitious structures may have cracking due to linear thermal expansion of the surfaces. It is therefore advisable to provide for their restoration by maintenance of the roof periodically according to the allocation of the structure, atmospheric pollution and degradation of the surface; typically every 2-4 years.
